Buying the Big Jets Paul Clark 2016-04-15 Selecting the right aircraft for an airline operation is a vastly complex process, involving a multitude of skills and considerable knowledge of the business. Buying The Big Jets was first published in 2001 to provide guidance to those involved in aircraft selection strategies. This Second Edition brings the picture fully up to date, incorporating new discussion on the strategies of low-cost carriers, and the significance of the aircraft cabin for long-haul operations. Latest developments in aircraft products are covered and there are fresh examples of best practice in airline fleet planning techniques. The book is essential reading for airline planners with fleet planning responsibility, consultancy groups, analysts studying aircraft performance and economics, airline operational personnel, students of air transport, leasing companies, aircraft value appraisers, and all who manage commercial aircraft acquisition programmes and provide strategic advice to decision-makers. This book is also a valuable tool for the banking community where insights into aircraft acquisition decisions are vital. Buying The Big Jets is an industry-specific example of strategic planning and is therefore a vital text for students engaged in graduate or post-graduate studies either in aeronautics or business administration.

Flying the Flag H. Dienel 1999-01-12 Since the end of World War II, European airlines have revealed their own operational style. By analyzing seven European flag-carriers, Dienel and Lyth provide a comparative study of the airline business, covering government policy, aircraft procurement, network growth, commercial performance and collaboration with other airlines and transport modes. This study also seeks to explain why national flag-carriers have survived in an age of globalization and strategic alliances. A concluding chapter views the contrasting American air transport industry.

Transforming Airlines Nawal K. Taneja 2020-03-19 This book provides a flight plan for riding the impending connectivity transformation curve. It takes the perspective of actionability, highlighting initiatives that executives in airlines and related businesses can use from the

insights of multi-industry executives. The emphasis is on execution, not on the concepts themselves. There is a cluster of at least four distinct megatrends that may converge to form disruptive conditions: (1) elevated expectations of existing and new customer segmentations, those who expect available and accessible air mass transportation systems, and those who expect connected services and seamless travel on different modes of transportation; (2) new emerging technology, incorporated in the air and ground vehicles, that will create new opportunities for existing and new service providers to offer new value propositions; (3) platforms developed around the ecosystem of customers; and (4) the impact on travel that the fast-changing demographic and economic characteristics of two major countries: India and China. These megatrends could lead existing or new businesses to create value propositions specifically dedicated to the new segments once each reaches a critical mass. Drawing on the author's own experience in the airline industry and related businesses, this book discusses the "how", relating to reimagining the business, re-entrepreneurship of the organization, innovating through partnerships, reengaging with customers and employees, and rebranding the business in response to these trends. This book is recommended reading for all senior-level practitioners of airlines and related businesses worldwide.

A320 Pilot Handbook Mike Ray 2013-04-13 If you are either an Airbus-driver or a serious flight simmer, this collection of information is something that should pique your interest. Learning to understand and operate one of the world's most complex machines is a tall request from a simple book like this ... and Captain Mike Ray is up to the task. His treatment of the airplane systems and operational techniques is written in an interesting and entertaining way ... and makes learning the difficult and complex ... well, almost easy. This over 400 page document is lavishly illustrated in full color to take advantage of the increased learning potential in the use of color. There can be no doubt that the Airbus A320 is a color driven systems airplane and this book attempts to take full advantage of the use of color in describing and illustrating the operations of the airplane systems and controls. Whatever price penalty is incurred in the purchasing of this color volume is well worth the investment in increased learning potential.

Stratospheric Flight Andras Sóbester 2011-06-28 In this book, Dr. Andras Sobester reviews the science behind high altitude flight. He takes the reader on a journey that begins with the complex physiological questions involved in taking humans into the "death zone." How does the body react to falling ambient pressure? Why is hypoxia (oxygen deficiency associated with low air pressure) so dangerous and why is it so difficult to 'design out' of aircraft, why does it still cause fatalities in the 21st century? What cabin pressures are air passengers and military pilots exposed to and why is the choice of an appropriate range of values such a difficult problem? How do high altitude life support systems work and what happens if they fail? What happens if cabin pressure is lost suddenly or, even worse, slowly and unnoticed? The second part of the book tackles the aeronautical problems of flying in the upper atmosphere. What loads does stratospheric flight place on pressurized cabins at high altitude and why are these difficult to predict? What determines the maximum altitude an aircraft can climb to? What is the 'coffin corner' and how can it be avoided? The history of aviation has seen a handful of airplanes reach altitudes in excess of 70,000 feet - what are the extreme engineering challenges of

climbing into the upper stratosphere? Flying high makes very high speeds possible -- what are the practical limits? The key advantage of stratospheric flight is that the aircraft will be 'above the weather' - but is this always the case? Part three of the book investigates the extreme atmospheric conditions that may be encountered in the upper atmosphere. How high can a storm cell reach and what is it like to fly into one? How frequent is high altitude 'clear air' turbulence, what causes it and what are its effects on aircraft? The stratosphere can be extremely cold - how cold does it have to be before flight becomes unsafe? What happens when an aircraft encounters volcanic ash at high altitude? Very high winds can be encountered at the lower boundary of the stratosphere - what effect do they have on aviation? Finally, part four looks at the extreme limits of stratospheric flight. How high will a winged aircraft will ever be able to fly? What are the ultimate altitude limits of ballooning? What is the greatest altitude that you could still bail out from? And finally, what are the challenges of exploring the stratospheres of other planets and moons? The author discusses these and many other questions, the known knowns, the known unknowns and the potential unknown unknowns of stratospheric flight through a series of notable moments of the recent history of mankind's forays into the upper atmospheres, each of these incidents, accidents or great triumphs illustrating a key aspect of what makes stratospheric flight aviation at the limit.

Airline Finance Peter S. Morrell 2007 Revised and updated in its third edition, this internationally renowned and respected book provides the essentials to understanding all areas of airline finance. Designed to address each of the distinct areas of financial management in an air transport industry context, it also shows how these fit together, while each chapter and topic provides a detailed resource which can be also consulted separately. Thoroughly amended and updated throughout, the third edition reflects the many developments that have affected the industry since 2001. It features several important new topics, including Low Cost Carriers (LCCs), fuel hedging and US Chapter 11 provisions.

Aerospace Marketing Management Philippe Malaval 2013-11-12 This book presents an overall picture of both B2B and B2C marketing strategies, concepts and tools, in the aeronautics sector. It addresses the most recent trends such as Social Marketing and the internet, Customer Orientation, Project Marketing and Concurrent Engineering, Coopetition, and Extended Enterprise. Aerospace Marketing Management is the first marketing handbook richly illustrated with executive and expert inputs as well as examples from parts suppliers, aircraft builders, airlines, helicopter manufacturers, aeronautics service providers, airports, defence and military companies, and industrial integrators (tier-1, tier-2). This book is designed as a ready reference for professionals and graduates from both Engineering and Business Schools.

Panic Free Tom Bunn 2019-04-30 "HURRY, BUY THE BOOK AND TRANSFORM YOUR LIFE." — Marla Friedman, PsyD, PC, board chairman, Badge of Life What if you could stop panic by tapping into a different part of your brain? After years of working to help sufferers of panic and anxiety, licensed therapist (and pilot) Tom Bunn discovered a highly effective solution that utilizes a part of the brain not affected by the stress hormones that bombard a person experiencing panic. This "unconscious procedural memory" can be programmed to control panic by preventing the release of stress hormones and activating the parasympathetic nervous system. This process, outlined in Panic Free, sounds complicated but is not, requiring just ten days and no drugs or doctors. Bunn includes specific instructions for dealing with common panic triggers, such as airplane travel, bridges, MRIs, and tunnels. Because panic is profoundly life-limiting, the program Bunn offers can be a real life-changer.

The Evolution of the US Airline Industry Eldad Ben-Yosef 2006-03-30 For over three decades the airline industry has continued to maintain a high profile in the public mind and in public policy interest. This high profile is probably not surprising. There does seem to be something inherently newsworthy about airplanes and the people and companies that fly them. The industry was one of the first major industries in the United States to undergo deregulation, in 1978. It thereby transitioned from a closely regulated sector (the former Civil Aeronautics Board tightly controlled every thing from prices to routes to entry) to one that is largely market oriented. The incumbent carriers transformed themselves from the point-to-point operators that the CAB had required to the hub-and-spokes structures that took better advantage of their network characteristics. Further, they transformed their pricing from the quite simple structures that the CAB had required to the highly differentiated/segmented pricing structures ("yield management") that reached an apogee in the late 1990s. Some carriers, like American, Delta, and United, were better at this transition; others, like Pan American, TWA, and Eastern, were not. What the incumbent carriers did not do, however, was deal with their costly wage and work rules structures, which were an enduring legacy of their regulatory period. This legacy, when combined with the high-fare end of the yield-management pricing structure, has made them vulnerable to entry by new carriers with lower cost structures.

Human Performance on the Flight Deck Don Harris 2016-12-05 Taking an integrated, systems approach to dealing exclusively with the human performance issues encountered on the flight deck of the modern airliner, this book describes the inter-relationships between the various application areas of human factors, recognising that the human contribution to the operation of an airliner does not fall into neat pigeonholes. The relationship between areas such as pilot selection, training, flight deck design and safety management is continually emphasised within the book. It also affirms the upside of human factors in aviation - the positive contribution that it can make to the industry - and avoids placing undue emphasis on when the human component fails. The book is divided into four main parts. Part one describes the underpinning science base, with chapters on human information processing, workload, situation awareness, decision

making, error and individual differences. Part two of the book looks at the human in the system, containing chapters on pilot selection, simulation and training, stress, fatigue and alcohol, and environmental stressors. Part three takes a closer look at the machine (the aircraft), beginning with an examination of flight deck display design, followed by chapters on aircraft control, flight deck automation, and HCI on the flight deck. Part four completes the volume with a consideration of safety management issues, both on the flight deck and across the airline; the final chapter in this section looks at human factors for incident and accident investigation. The book is written for professionals within the aviation industry, both on the flight deck and elsewhere, for post-graduate students and for researchers working in the area.

Sagittarius Rising Cecil Lewis 2014-05-27 A memoir by a WWI fighter pilot, with the adventurous spirit of *War Horse* and the charm of *The Little Prince* A singular, lyrical book, *Sagittarius Rising* is at once an exuberant memoir from the Lost Generation and a riveting tale of the early days of flight during World War I. Cecil Lewis lied his way into the British Army's Royal Flying Corps at age sixteen and was ordered to a squadron on the Western Front only a year later. At the time, flying was so new that designers hadn't even decided on basic mechanics such as how many wings a plane should have. Despite this, Lewis mastered virtually every kind of single-engine plane in the RFC, going on to excel in active duty and even to dogfight the Red Baron—and live to tell the tale. Full of infectious charm and written with the prose and pacing of a novel, *Sagittarius Rising* beautifully recounts Lewis's harrowing exploits in the sky alongside his wild times of partying and chasing girls while on leave in London. His coming-of-age story is unlike any other WWI memoir you've read before. For more than seventy years, Penguin has been the leading publisher of classic literature in the English-speaking world. Biokerosene Martin Kaltschmitt 2017-08-09 This book provides a detailed overview of aspects related to the overall provision chain for biokerosene as part of the global civil aviation business. Starting with a review of the current market situation for aviation fuels and airplanes and their demands, it then presents in-depth descriptions of classical and especially new types of non-edible biomass feedstock suitable for biokerosene provision. Subsequent chapters discuss those fuel provision processes that are already available and those still under development based on various biomass feedstock materials, and present e.g. an overview of the current state of the art in the production of a liquid biomass-based fuel fulfilling the specifications for kerosene. Further, given the growing interest of the aviation industry and airlines in biofuels for aviation, the experiences of an air-carrier are presented. In closing, the book provides a market outlook for biokerosene. Addressing a broad range of aspects related to the pros and cons of biokerosene as a renewable fuel for aviation, the book offers a unique resource.

Boeing Versus Airbus John Newhouse 2007-01-16 The commercial airline industry is one of the most volatile, dog-eat-dog enterprises in the world, and in the late 1990s, Europe's Airbus overtook America's Boeing as the preeminent aircraft manufacturer. However, Airbus quickly succumbed to the same complacency it once challenged, and Boeing regained its precarious place on top. Now, after years of heated battle and mismanagement, both companies face the challenge of serving burgeoning Asian markets and stiff competition from China and Japan. Combining insider knowledge with vivid prose and insight, John Newhouse delivers a riveting

story of these two titans of the sky and their struggles to stay in the air.

Systems of Commercial Turbofan Engines Andreas Linke-Diesinger 2008-05-21 To understand the operation of aircraft gas turbine engines, it is not enough to know the basic operation of a gas turbine. It is also necessary to understand the operation and the design of its auxiliary systems. This book fills that need by providing an introduction to the operating principles underlying systems of modern commercial turbofan engines and bringing readers up to date with the latest technology. It also offers a basic overview of the tubes, lines, and system components installed on a complex turbofan engine. Readers can follow detailed examples that describe engines from different manufacturers. The text is recommended for aircraft engineers and mechanics, aeronautical engineering students, and pilots.

Climate Change and Aviation Stefan Gossling 2012-05-04 'This is a timely, challenging and fascinating book on a topic of central importance to the success or otherwise of our climate change policies. It sets down a clear marker for what has to be done in the aviation sector.' Professor John Whitelegg, Stockholm Environment Institute, University of York, UK 'Climate Change and Aviation presents a clear picture of the transport sector's greatest challenge: how to reconcile aviation's immense popularity with its considerable environmental damage and its dependence on liquid hydrocarbon energy sources. This book avoids wishful thinking and takes the much harder, but more productive, path of considering difficult solutions that clash with short-term and short-sighted expectations about the unlimited growth potential for flying.'

Professor Anthony Perl, Urban Studies Program, Simon Fraser University, Canada 'A convincing and timely collection that brings together an impressive range of expertise. The book integrates various perspectives into a powerful core argument - we must do something, and quickly, to tackle the impact of aviation on our environment. The authors recognise the political difficulties associated with promoting change but present constructive options for policy makers. Required reading, especially for transport ministers set on promoting the growth of air travel.' Professor Jon Shaw, Director of the Centre for Sustainable Transport, University of Plymouth, UK Trends such as the massive growth in availability of air travel and air freight are among those which have led to aviation becoming one of the fastest growing emitters of greenhouse gases. These trends have also caused a shift in expectations of how we do business, where we go on holiday, and what food and goods we can buy. For these reasons aviation is (and is set to stay) high up on global political, organizational and media agendas. This textbook is the first to attempt a comprehensive review of the topic, bringing together an international team of leading scientists. Starting with the science of the environmental issues, it moves on to cover drivers and trends of growth, socio-economics and politics, as well as mitigation options, the result being a broad yet detailed examination of the field. This is essential reading for undergraduate and postgraduate courses in transport, tourism, the environment, geography and beyond, while also being a valuable resource for professionals and policymakers seeking a clear understanding of this complex yet urgently pressing issue.

Aircraft Design Daniel P. Raymer 2006-01-01 Winner of the Summerfield Book Award Winner of the Aviation-Space Writers Association Award of Excellence. --Over 30,000 copies sold, consistently the top-selling AIAA textbook title This highly regarded textbook presents the entire process of aircraft conceptual design from requirements definition to initial sizing, configuration

The Evolution of the Airline Industry James Baldwin 2019-08-18 This book gives a brief but concise narrative on the evolution of the airline industry from its beginnings to the present day.

The focus is on regulations, historic events and influencing factors that shaped the industry.

Starting with the Wright Flyer, the book details the early conventions and regulatory framework, the development of the commercial airline industry through the 1930s, World War II and the Chicago Convention, that created the current regulatory framework of the industry. The book

then goes into the regulated and protectionist era and developments that eventually led to the deregulation and liberalization of the industry. At this point, the industry transcended from heavy government involvement to an industry driven by economic factors. Following this

change, the industry experienced unprecedented growth leading to the formation of the so-

called Sixth Freedom airlines, the airline alliances and the low-cost and ultra-low-cost carriers.

This book is an excellent guide to how the airline industry evolved into what it is today.

Smart Intelligent Aircraft Structures (SARISTU) Piet Christof Wölcken 2015-09-04 The book includes the research papers presented in the final conference of the EU funded SARISTU

(Smart Intelligent Aircraft Structures) project, held at Moscow, Russia between 19-21 of May 2015. The SARISTU project, which was launched in September 2011, developed and tested a

variety of individual applications as well as their combinations. With a strong focus on actual physical integration and subsequent material and structural testing, SARISTU has been

responsible for important progress on the route to industrialization of structure integrated

functionalities such as Conformal Morphing, Structural Health Monitoring and Nanocomposites.

The gap- and edge-free deformation of aerodynamic surfaces known as conformal morphing

has gained previously unrealized capabilities such as inherent de-icing, erosion protection and lightning strike protection, while at the same time the technological risk has been greatly

reduced. Individual structural health monitoring techniques can now be applied at the part-

manufacturing level rather than via extending an aircraft's time in the final assembly line. And

nanocomposites no longer lose their improved properties when trying to upscale from neat

resin testing to full laminate testing at element level. As such, this book familiarizes the reader

with the most significant developments, achievements and key technological steps which have

been made possible through the four-year long cooperation of 64 leading entities from 16

different countries with the financial support of the European Commission.
