Undressing Cinema Stella Bruzzi 2012-10-12 From Audrey Hepburn in Givenchy, to sharp-suited gangsters in Tarantino movies, clothing is central to film. In Undressing Cinema, Stella Bruzzi explores how far from being mere accessories, clothes are key elements in the construction of cinematic identities, and she proposes new and dynamic links between cinema, fashion and costume history, gender, queer theory and psychoanalysis. Bruzzi uses case studies drawn from contemporary popular cinema to reassess established ideas about costume and fashion in cinema, and to challenge conventional interpretations of how masculinity and femininity are constructed through clothing. Her wide-ranging study encompasses: * haute couture in film and the rise of the movie fashion designer, from Givenchy to Gaultier * the eroticism of period costume in films such as *The Piano* and *The Age of Innocence* * clothing the modern femme fatale in *Single White Female*, *Disclosure* and *The Last Seduction* * generic male chic in *Goodfellas*, *Reservoir Dogs*, and *Leon* * pride, costume and masculinity in 'Blaxploitation' films, *Boyz n The Hood* and *New Jack City* * drag and gender confusion in cinema, from the unerotic cross-dressing of *Mrs Doubtfire* to the eroticised ambiguity of *Orlando*.

Multi-Modality Atherosclerosis Imaging and Diagnosis Luca Saba 2013-09-13 Stroke is one of the leading causes of death in the world, resulting mostly from the sudden ruptures of atherosclerosis carotid plaques. Understanding why and how plaque develops and ruptures requires a multi-disciplinary approach such as radiology, biomedical engineering, medical physics, software engineering, hardware engineering, pathological and histological imaging. Multi-Modality Atherosclerosis Imaging, Diagnosis and Treatment presents a new dimension of understanding Atherosclerosis in 2D and 3D. This book presents work on plaque stress analysis in order to provide a general framework of computational modeling with atherosclerosis plaques. New algorithms based on 3D and 4D Ultrasound are presented to assess the atherosclerotic disease as well as very recent advances in plaque multimodality image fusion analysis. The goal of Multi-Modality Atherosclerosis Imaging, Diagnosis and Treatment is to fuse information obtained from different 3D medical image modalities, such as 3D US, CT and MRI, providing the medical doctor with some sort of augmented reality information about the atherosclerotic plaque in order to improve the accuracy of the diagnosis. Analysis of the plaque dynamics along the cardiac cycle is also a valuable indicator for plaque instability assessment and therefore for risk stratification. 4D Ultrasound, a sequence of 3D reconstructions of the region of interest along the time, can be used for this dynamic analysis. Multimodality Image Fusion is a very appealing approach because it puts together the

best characteristics of each modality, such as, the high temporal resolution of US and the high spatial resolutions of MRI and CT.

Microscopy of Semiconducting Materials 2007 A.G. Cullis 2008-12-02 This volume contains invited and contributed papers presented at the conference on 'Microscopy of Semiconducting Materials' held at the University of Cambridge on 2-5 April 2007. The event was organised under the auspices of the Electron Microscopy and Analysis Group of the Institute of Physics, the Royal Microscopical Society and the Materials Research Society. This international conference was the fifteenth in the series that focuses on the most recent world-wide advances in semiconductor studies carried out by all forms of microscopy and it attracted delegates from more than 20 countries. With the relentless evolution of advanced electronic devices into ever smaller nanoscale structures, the problem relating to the means by which device features can be visualised on this scale becomes more acute. This applies not only to the imaging of the general form of layers that may be present but also to the determination of composition and doping variations that are employed. In view of this scenario, the vital importance of transmission and scanning electron microscopy, together with X-ray and scanning probe approaches can immediately be seen. The conference featured developments in high resolution microscopy and nanoanalysis, including the exploitation of recently introduced aberration-corrected electron microscopes. All associated imaging and analytical techniques were demonstrated in studies including those of self-organised and quantum domain structures. Many analytical techniques based upon scanning probe microscopies were also much in evidence, together with more general applications of X-ray diffraction methods.
